

# Cornerstone Textures

Parts of our Cornerstone signs are available in a variety of brick, stone and other faux textures. These textures are made from the same materials as the rest of the sign.

Samples shown here are our most popular Cornerstone textures. Custom textures are available with a reference photo.

Due to differences between monitors and display settings, the samples shown are close approximations of our true material colors.

## REFERENCE PHOTOS

A custom texture is possible by providing a high-resolution reference photo. These textures can come from your organization's building or other masonry structure.

Using your phone or digital camera, take a straight-on and level photo using the high resolution setting. Be sure that the reference subject is well-lit. If there is a repeating pattern, be sure to capture the entire pattern in your photo.

Most brick textures come in a standard brick shape of 2 1/4" x 8". Custom brick textures are also available for an additional charge. If you are attempting to match a certain color, it is recommended to provide a specific Sherwin-Williams or Benjamin Moore color code for each color you wish to specify.

For stone textures, including a ruler or tape measure near the edge of the photo will help us to determine the scale of the texture. Email the original image file to your Stewart sign consultant. Images must be of sufficient quality to be used.

*PLEASE NOTE: While every attempt will be made to match the texture in color and style, these faux textures are meant to be viewed at a distance. Up-close detail will not be an exact match to original reference materials. A physical texture sample will be mailed to you for approval or feedback prior to manufacture.*
